Real public cross-asset stress breadth

Research-desk readout from real public data

- Public stress breadth is 42.9%: partially broadening, but not yet a broad public regime signal.
- One-month direction is accelerating: the 75th-percentile breadth changed 28.6 percentage points.
- Depth is meaningful but not absolute: median cross-asset stress is at the 69.3th percentile and 57.1% of assets are above their 60th stress percentile.
- Leadership is visible: USO, GLD, and SPY are the strongest current public stress components; USO sits at the 93.1th percentile.
- Concentration check: the leader is 23.7 percentile points above the median, meaning stress is becoming more evenly distributed across the visible sleeves.
- Research-desk implication: the question is not whether one market moved, but whether public stress is broadening enough to justify a regime-transmission watch.
